PRESS RELEASE

Spring lawn revival

With the wintery weather behind us it is time to start thinking about rejuvenating the lawn ready for the summer.

The key to improving the health of your lawn is to start with the soil, Neudorff's Lawn Feed & Improver contains a unique combination of soil-revitalising microorganisms and Mycorrhiza fungi, which helps encourage a thick, lush lawn that is more resistant to drought and frost with a root system up to 150 times bigger.

Mycorrhiza is always present in the soil but only in small quantities, when it comes into contact with the roots of the grass it forms a permanent and lasting bond. The microorganisms convert the organically bound nutrients in the fertiliser into a form that the lawn can easily utilise. The formula can be scattered directly from the bag or by hand.

For lawns with a moss problem, Organic Moss Control for Lawns Concentrate fights any build up in lawns effectively using its natural active ingredient, pelargonic acid, which is found naturally in pelargoniums and guarantees fast visible results without harming the lawn.

The concentrated biodegradable formula can be applied to the lawn with a watering can. It gets to work at low temperatures and once dry, pets may be allowed access to treated areas.
